

AAA616: Program Analysis

Lecture 2 — Denotational Semantics

Hakjoo Oh
2016 Fall

The While Language

- Syntax

$$a \rightarrow n \mid x \mid a_1 + a_2 \mid a_1 \star a_2 \mid a_1 - a_2$$

$$b \rightarrow \text{true} \mid \text{false} \mid a_1 = a_2 \mid a_1 \leq a_2 \mid \neg b \mid b_1 \wedge b_2$$

$$c \rightarrow x := a \mid \text{skip} \mid c_1; c_2 \mid \text{if } b \text{ } c_1 \text{ } c_2 \mid \text{while } b \text{ } c$$

- Semantics

- ▶ $\mathcal{A}[a] : \text{State} \rightarrow \mathbb{Z}$
- ▶ $\mathcal{B}[b] : \text{State} \rightarrow T$
- ▶ $\mathcal{C}[c] : \text{State} \hookrightarrow \text{State}$

Semantics of Arithmetic Expressions

$$\mathcal{A}[\![a]\!] : \text{State} \rightarrow \mathbf{Z}$$

$$\mathcal{A}[\![n]\!](s) = n$$

$$\mathcal{A}[\![x]\!](s) = s(x)$$

$$\mathcal{A}[\![a_1 + a_2]\!](s) = \mathcal{A}[\![a_1]\!](s) + \mathcal{A}[\![a_2]\!](s)$$

$$\mathcal{A}[\![a_1 \star a_2]\!](s) = \mathcal{A}[\![a_1]\!](s) \times \mathcal{A}[\![a_2]\!](s)$$

$$\mathcal{A}[\![a_1 - a_2]\!](s) = \mathcal{A}[\![a_1]\!](s) - \mathcal{A}[\![a_2]\!](s)$$

Semantics of Boolean Expressions

$$\mathcal{B}[\![b]\!] : \text{State} \rightarrow \mathbf{T}$$

$$\mathcal{B}[\![\text{true}]\!](s) = \text{true}$$

$$\mathcal{B}[\![\text{false}]\!](s) = \text{false}$$

$$\mathcal{B}[\![a_1 = a_2]\!](s) = \mathcal{B}[\![a_1]\!](s) = \mathcal{B}[\![a_2]\!](s)$$

$$\mathcal{B}[\![a_1 \leq a_2]\!](s) = \mathcal{B}[\![a_1]\!](s) \leq \mathcal{B}[\![a_2]\!](s)$$

$$\mathcal{B}[\![\neg b]\!](s) = \mathcal{B}[\![b]\!](s) = \text{false}$$

$$\mathcal{B}[\![b_1 \wedge b_2]\!](s) = \mathcal{B}[\![b_1]\!](s) \wedge \mathcal{B}[\![b_2]\!](s)$$

Semantics of Commands

$$\begin{aligned}\mathcal{C}[\![c]\!]\quad &:\quad \mathbf{State} \hookrightarrow \mathbf{State} \\ \mathcal{C}[\![x := a]\!] &= \lambda s. s[x \mapsto \mathcal{A}[\![a]\!](s)] \\ \mathcal{C}[\![\text{skip}]\!] &= \mathbf{id} \\ \mathcal{C}[\![c_1; c_2]\!] &= \mathcal{C}[\![c_2]\!] \circ \mathcal{C}[\![c_1]\!] \\ \mathcal{C}[\![\text{if } b \text{ } c_1 \text{ } c_2]\!] &= \mathbf{cond}(\mathcal{B}[\![b]\!], \mathcal{C}[\![c_1]\!], \mathcal{C}[\![c_2]\!]) \\ \mathcal{C}[\![\text{while } b \text{ } c]\!] &= fix F \\ &\quad \text{where } F(g) = \mathbf{cond}(\mathcal{B}[\![b]\!], g \circ \mathcal{C}[\![c]\!], \mathbf{id})\end{aligned}$$

Example

```
while  $\neg(x = 0)$  skip
```

Need for Theory

- Does the least fixed point (i.e. $\text{fix } F$) always exist?
- Is $\text{fix } F$ unique?
- What is the constructive definition of $\text{fix } F$?

Fixed Point Theory

Theorem (Kleene)

Let $f : D \rightarrow D$ be a continuous function on a CPO D . Then f has a (unique) least fixed point, $\text{fix}(f)$, and

$$\text{fix}(f) = \bigsqcup_{n \geq 0} f^n(\perp).$$

The denotational semantics is well-defined if

- **State** \hookrightarrow **State** is a CPO, and
- $F : (\text{State} \hookrightarrow \text{State}) \rightarrow (\text{State} \hookrightarrow \text{State})$ is a continuous function.

Plan

- Complete Partial Order
- Continuous Functions
- Least Fixed Point

Partially Ordered Set

Definition (Partial Order)

We say a binary relation \sqsubseteq is a partial order on a set D iff \sqsubseteq is

- reflexive: $\forall p \in D. p \sqsubseteq p$
- transitive: $\forall p, q, r \in D. p \sqsubseteq q \wedge q \sqsubseteq r \implies p \sqsubseteq r$
- anti-symmetric: $\forall p, q \in D. p \sqsubseteq q \wedge q \sqsubseteq p \implies p = q$

We call such a pair (D, \sqsubseteq) partially ordered set, or poset.

Lemma

If a partially ordered set (D, \sqsubseteq) has a least element d , then d is unique.

Examples

Exercise (Powerset)

Let S be a non-empty set. Prove that $(\wp(S), \subseteq)$ is a partially ordered set.

Examples

Exercise (Partial Functions)

Let $X \hookrightarrow Y$ be the set of all partial functions from a set X to a set Y , and define $f \sqsubseteq g$ iff

$$\text{dom}(f) \subseteq \text{dom}(g) \wedge \forall x \in \text{dom}(f). f(x) = g(x).$$

Prove that $(X \hookrightarrow Y, \sqsubseteq)$ is a partially ordered set.

Least Upper Bound

Definition (Least Upper Bound)

Let (D, \sqsubseteq) be a partially ordered set and let Y be a subset of D . An upper bound of Y is an element d of D such that

$$\forall d' \in Y. d' \sqsubseteq d.$$

An upper bound d of Y is a least upper bound if and only if $d \sqsubseteq d'$ for every upper bound d' of Y . The least upper bound of Y is denoted by $\sqcup Y$.

Lemma

If Y has a least upper bound d , then d is unique.

Chain

Definition (Chain)

Let (D, \sqsubseteq) be a poset and Y a subset of D . Y is called a chain if Y is totally ordered:

$$\forall y_1, y_2 \in Y. y_1 \sqsubseteq y_2 \text{ or } y_2 \sqsubseteq y_1.$$

Example

Consider the poset $(\wp(\{a, b, c\}), \sqsubseteq)$.

- $Y_1 = \{\emptyset, \{a\}, \{a, c\}\}$
- $Y_2 = \{\emptyset, \{a\}, \{c\}, \{a, c\}\}$

Complete Partial Order (CPO)

Definition (CPO)

A poset (D, \sqsubseteq) is a CPO, if every chain $Y \subseteq D$ has $\sqcup Y \in D$.

Definition (Complete Lattice)

A poset (D, \sqsubseteq) is a complete lattice, if every subset $Y \subseteq D$ has $\sqcup Y \in D$.

Lemma

If (D, \sqsubseteq) is a CPO, then it has a least element \perp given by $\perp = \sqcup \emptyset$.

Examples

Example

Let S be a non-empty set. Then, $(\wp(S), \subseteq)$ is a CPO. The lub $\sqcup Y$ for Y is $\bigcup Y$. The least element is \emptyset .

Examples

Example

The poset $(X \hookrightarrow Y, \sqsubseteq)$ of all partial functions from a set X to a set Y , equipped with the partial order

$$\text{dom}(f) \subseteq \text{dom}(g) \wedge \forall x \in \text{dom}(f). f(x) = g(x)$$

is a CPO (but not a complete lattice). The lub of a chain Y is the partial function f with $\text{dom}(f) = \bigcup_{f_i \in Y} \text{dom}(f_i)$ and

$$f(x) = \begin{cases} f_n(x) & \cdots x \in \text{dom}(f_i) \text{ for some } f_i \in Y \\ \text{undef} & \cdots \text{otherwise} \end{cases}$$

The least element $\perp = \lambda x.\text{undef}$.

Monotone Functions

Definition (Monotone Functions)

A function $f : D \rightarrow E$ between posets is *monotone* iff

$$\forall d, d' \in D. d \sqsubseteq d' \implies f(d) \sqsubseteq f(d').$$

Example

Consider $(\wp(\{a, b, c\}), \subseteq)$ and $(\wp(\{d, e\}), \subseteq)$ and two functions $f_1, f_2 : \wp(\{a, b, c\}) \rightarrow \wp(\{d, e\})$

X	$\{a, b, c\}$	$\{a, b\}$	$\{a, c\}$	$\{b, c\}$	$\{a\}$	$\{b\}$	$\{c\}$	\emptyset
$f_1(X)$	$\{d, e\}$	$\{d\}$	$\{d, e\}$	$\{d, e\}$	$\{d\}$	$\{d\}$	$\{e\}$	\emptyset
X	$\{a, b, c\}$	$\{a, b\}$	$\{a, c\}$	$\{b, c\}$	$\{a\}$	$\{b\}$	$\{c\}$	\emptyset
$f_2(X)$	$\{d\}$	$\{d\}$	$\{d\}$	$\{e\}$	$\{d\}$	$\{e\}$	$\{e\}$	$\{e\}$

Exercise

Determine which of the following functionals of

$$(\text{State} \hookrightarrow \text{State}) \rightarrow (\text{State} \hookrightarrow \text{State})$$

are monotone:

① $F_0(g) = g.$

② $F_1(g) = \begin{cases} g_1 & \dots g_1 = g_2 \\ g_2 & \dots \text{otherwise} \end{cases} \text{ where } g_1 \neq g_2.$

③ $F_2(g) = \lambda s. \begin{cases} g(s) & \dots s(x) \neq 0 \\ s & \dots s(x) = 0 \end{cases}$

Properties of Monotone Functions

Lemma

Let (D_1, \sqsubseteq_1) , (D_2, \sqsubseteq_2) , and (D_3, \sqsubseteq_3) be CPOs. Let $f : D_1 \rightarrow D_2$ and $g : D_2 \rightarrow D_3$ be monotone functions. Then, $g \circ f : D_1 \rightarrow D_3$ is a monotone function.

Properties of Monotone Functions

Lemma

Let (D_1, \sqsubseteq_1) and (D_2, \sqsubseteq_2) be CPOs. Let $f : D_1 \rightarrow D_2$ be a monotone function. If Y is a chain in D_1 , then $f(Y) = \{f(d) \mid d \in Y\}$ is a chain in D_2 . Furthermore,

$$\bigsqcup f(Y) \sqsubseteq f(\bigsqcup Y).$$

Continuous Functions

Definition (Continuous Functions)

A function $f : D_1 \rightarrow D_2$ defined on posets (D_1, \sqsubseteq_1) and (D_2, \sqsubseteq_2) is continuous if it is monotone and it preserves least upper bounds of chains:

$$\bigsqcup f(Y) = f(\bigsqcup Y)$$

for all non-empty chains Y in D_1 . If $f(\bigsqcup Y) = \bigsqcup f(Y)$ holds for the empty chain (that is, $\perp = f(\perp)$), then we say that f is strict.

Properties of Continuous Functions

Lemma

Let $f : D_1 \rightarrow D_2$ be a monotone function defined on posets (D_1, \sqsubseteq_1) and (D_2, \sqsubseteq_2) and D_1 is a finite set. Then, f is continuous.

Properties of Continuous Functions

Lemma

Let (D_1, \sqsubseteq_1) , (D_2, \sqsubseteq_2) , and (D_3, \sqsubseteq_3) be CPOs. Let $f : D_1 \rightarrow D_2$ and $g : D_2 \rightarrow D_3$ be continuous functions. Then, $g \circ f : D_1 \rightarrow D_3$ is a continuous function.

Least Fixed Points

Definition (Fixed Point)

Let (D, \sqsubseteq) be a poset. A *fixed point* of a function $f : D \rightarrow D$ is an element $d \in D$ such that $f(d) = d$. We write $\text{fix}(f)$ for the *least fixed point* of f , if it exists, such that

- $f(\text{fix}(f)) = \text{fix}(f)$
- $\forall d \in D. f(d) = d \implies \text{fix}(f) \sqsubseteq d$

Fixed Point Theorem

Theorem (Kleene Fixed Point)

Let $f : D \rightarrow D$ be a continuous function on a CPO D . Then f has a least fixed point, $\text{fix}(f)$, and

$$\text{fix}(f) = \bigsqcup_{n \geq 0} f^n(\perp)$$

where $f^n(\perp) = \begin{cases} \perp & n = 0 \\ f(f^{n-1}(\perp)) & n > 0 \end{cases}$

Proof

We show the claims of the theorem by showing that $\bigsqcup_{n \geq 0} f^n(\perp)$ exists and it is indeed equivalent to $\text{fix}(f)$. First note that $\bigsqcup_{n \geq 0} f^n(\perp)$ exists because $f^0(\perp) \sqsubseteq f^1(\perp) \sqsubseteq f^2(\perp) \sqsubseteq \dots$ is a chain. We show by induction that $\forall n \in \mathbb{N}. f^n(\perp) \sqsubseteq f^{n+1}(\perp)$:

- $\perp \sqsubseteq f(\perp)$ (\perp is the least element)
- $f^n(\perp) \sqsubseteq f^{n+1}(\perp) \implies f^{n+1}(\perp) \sqsubseteq f^{n+2}(\perp)$ (monotonicity of f)

Now, we show that $\text{fix}(f) = \bigsqcup_{n \geq 0} f^n(\perp)$ in two steps:

- We show that $\bigsqcup_{n \geq 0} f^n(\perp)$ is a fixed point of f :

$$\begin{aligned} f\left(\bigsqcup_{n \geq 0} f^n(\perp)\right) &= \bigsqcup_{n \geq 0} f(f^n(\perp)) && \text{continuity of } f \\ &= \bigsqcup_{n \geq 0} f^{n+1}(\perp) \\ &= \bigsqcup_{n \geq 0} f^n(\perp) \end{aligned}$$

Proofs

- We show that $\bigsqcup_{n \geq 0} f^n(\perp)$ is smaller than all the other fixed points.
Suppose d is a fixed point, i.e., $f(d) = d$. Then,

$$\bigsqcup_{n \geq 0} f^n(\perp) \sqsubseteq d$$

since $\forall n \in \mathbb{N}. f^n(\perp) \sqsubseteq d$:

$$f^0(\perp) = \perp \sqsubseteq d, \quad f^n(\perp) \sqsubseteq d \implies f^{n+1}(\perp) \sqsubseteq f(d) = d.$$

Therefore, we conclude

$$\text{fix}(f) = \bigsqcup_{n \geq 0} f^n(\perp).$$

Well-definedness of the Semantics

The function F

$$F(g) = \mathbf{cond}(\mathcal{B}\llbracket b \rrbracket, g \circ \mathcal{C}\llbracket c \rrbracket, \mathbf{id})$$

is continuous.

Lemma

Let $g_0 : \mathbf{State} \hookrightarrow \mathbf{State}$, $p : \mathbf{State} \rightarrow \mathbf{T}$, and define

$$F(g) = \mathbf{cond}(p, g, g_0).$$

Then, F is continuous.

Lemma

Let $g_0 : \mathbf{State} \hookrightarrow \mathbf{State}$, and define

$$F(g) = g \circ g_0.$$

Then F is continuous.
