## Homework 5: Type Checker COSE212, Fall 2016

## Hakjoo Oh

## Due: 12/2, 24:00

**Problem 1** Consider the LETREC language:

type exp =
 | CONST of int
 | VAR of var
 | ADD of exp \* exp
 | SUB of exp \* exp
 | MUL of exp \* exp
 | DIV of exp \* exp
 | ISZERO of exp
 | IF of exp \* exp \* exp
 | LET of var \* exp \* exp
 | LETREC of var \* var \* exp \* exp
 | CALL of exp \* exp
 and var = string

Types for the language are defined as follows:

type typ = TyInt | TyBool | TyFun of typ \* typ | TyVar of tyvar and tyvar = string

Implement the following type-inference function:

typeof : exp -> typ

which takes a program and returns its type if the program is well-typed. When the program is ill-typed, typeof should raise an exception TypeError. Examples:

• The program

```
PROC ("f",

PROC ("x", SUB (CALL (VAR "f", CONST 3),

CALL (VAR "f", VAR "x"))))
```

has type TyFun (TyFun (TyInt, TyInt), TyFun (TyInt, TyInt)).

• The program

PROC ("f", CALL (VAR "f", CONST 11))

has type TyFun (TyFun (TyInt, TyVar "t"), TyVar "t"), where t can be any type variable.

• The program

LET ("x", CONST 1, IF (VAR "x", SUB (VAR "x", CONST 1), CONST 0))

is ill-typed, so typeof should raise an exception TypeError.

As discussed in class, **typeof** is defined with two functions: one for generating type equations and the other for solving the equations. Your job is to complete the implementation of these two functions:

Modules for type environments (TEnv) and substitutions (Subst), as well as the operations of applying substitutions to types (Subst.apply) and extending substitutions (Subst.extend), are provided. Also, a parser will be provided.
