## COSE215: Theory of Computation

## Lecture 6 - Properties of Regular Languages (1)

Hakjoo Oh<br>2016 Spring

## Properties of Regular Languages

- Closure properties
- "Pumping Lemma" for regular languages

## Closure Properties

If one (or several) languages are regular, then certain related languages are also regualr. E.g.,

- Given regular languages $\boldsymbol{L}_{1}$ and $\boldsymbol{L}_{2}, \boldsymbol{L}_{1} \cup \boldsymbol{L}_{2}$ is also regular.
- Given regular languages $\boldsymbol{L}_{1}$ and $\boldsymbol{L}_{2}, \boldsymbol{L}_{1} \cap \boldsymbol{L}_{2}$ is also regular.

The family of regular languages is closed under union and intersection.

## Closure Properties

Regular languages are closed under:

- union
- difference
- complementation
- intersection
- reversal
- homomorphism

## Closure under Union

Theorem
If $\boldsymbol{L}$ and $\boldsymbol{M}$ are regular languages, then so is $\boldsymbol{L} \cup \boldsymbol{M}$.

## Closure under Difference

Theorem
If $L$ and $M$ are regular languages, then so is $L-M$.

## Closure under Complementation

## Theorem

If $\boldsymbol{L}$ is a regular language over alphabet $\boldsymbol{\Sigma}$, then $\overline{\boldsymbol{L}}=\boldsymbol{\Sigma}^{*}-\boldsymbol{L}$ is also a regular language.

Let $\boldsymbol{A}$ be a DFA that accepts $\boldsymbol{L}$, i.e., $\boldsymbol{L}=\boldsymbol{L}(\boldsymbol{A})$ for DFA $\boldsymbol{A}=\left(\boldsymbol{Q}, \boldsymbol{\Sigma}, \boldsymbol{\delta}, q_{0}, \boldsymbol{F}\right)$. Define a DFA $\boldsymbol{B}$ as follows:

$$
B=\left(Q, \Sigma, \delta, q_{0}, Q-F\right)
$$

## Closure under Intersection

Theorem
If $\boldsymbol{L}$ and $\boldsymbol{M}$ are regular languages, then so is $\boldsymbol{L} \cap \boldsymbol{M}$.

- Non-constructive proof: $L \cap M=\overline{\bar{L} \cup \bar{M}}$
- Constructive proof: construct an automaton that accepts $L \cap M$.

## Closure under Intersection

## Theorem

If $L$ and $M$ are regular languages, then so is $L \cap M$.

- Non-constructive proof: $L \cap M=\overline{\bar{L} \cup \bar{M}}$
- Constructive proof: construct an automaton that accepts $L \cap M$.
(Constructive proof) Let $\boldsymbol{A}_{\mathbf{1}}=\left(\boldsymbol{Q}, \boldsymbol{\Sigma}, \boldsymbol{\delta}_{1}, \boldsymbol{q}_{0}, \boldsymbol{F}_{1}\right)$ and $A_{2}=\left(P, \Sigma, \delta_{2}, p_{0}, F_{2}\right)$ be DFAs for $L$ and $M$, respectively. Define the automaton $\boldsymbol{A}$ :

$$
A=\left(Q \times P, \Sigma, \delta,\left(q_{0}, p_{0}\right), F_{1} \times F_{2}\right)
$$

where $\delta((q, p), a)=\left(\delta_{1}(q, a), \delta_{2}(p, a)\right)$. Then, $L(A)=L\left(A_{1}\right) \cap L\left(A_{2}\right)$.

## Closure under Reversal

## Theorem

If $\boldsymbol{L}$ is a regular language, then so is $\boldsymbol{L}^{R}$.
Let $\boldsymbol{A}$ be a $\boldsymbol{\epsilon}$-NFA that accepts $\boldsymbol{L}$, then we can construct an automaton that accepts $L^{R}$ as follows:
(1) Reverse all the arcs in the transition graph for $\boldsymbol{A}$.
(2) Make the start state of $\boldsymbol{A}$ be the only accepting state for the new automaton.
(0) Create a new start state $p_{0}$ with transitions on $\epsilon$ to all the accepting states of $\boldsymbol{A}$.

## Closure under Homomorphism

## Definition (Homomorphism)

Suppose $\boldsymbol{\Sigma}$ and $\boldsymbol{\Gamma}$ are alphabets. Then a function

$$
h: \Sigma \rightarrow \Gamma^{*}
$$

is called a homomorphism. For a given string $w=a_{1} a_{2} \cdots a_{n}$,

$$
h(w)=h\left(a_{1}\right) h\left(a_{2}\right) \cdots h\left(a_{n}\right)
$$

For a language $\boldsymbol{L}$,

$$
h(L)=\{h(w) \mid w \in L\}
$$

Theorem
If $\boldsymbol{L}$ is a regular language over $\boldsymbol{\Sigma}$ and $\boldsymbol{h}$ is a homomorphism on $\boldsymbol{\Sigma}$, then $\boldsymbol{h}(\boldsymbol{L})$ is also regular.
