## Properties of CFLs

- Normal forms for CFGs
- Pumping lemma for CFLs
- Closure properties for CFLs

## Chomsky Normal Form

## Definition

A CFG is in Chomsky Normal Form (CNF), if its all productions are of the form

$$
A \rightarrow B C \text { or } A \rightarrow \boldsymbol{a}
$$

Theorem
Every CFL (without $\epsilon$ ) has a CFG in CNF.

## Preliminary Simplications

(1) Elimination of useless symbols
(2) Elimination of $\epsilon$-productions
(3) Elimination of unit productions

## Useless Symbols

## Definition (Useful/Useless Symbols)

A symbol $\boldsymbol{X}$ is useful for a grammar $\boldsymbol{G}=(\boldsymbol{V}, \boldsymbol{T}, \boldsymbol{S}, \boldsymbol{P})$ if there is some derivation of the form $\boldsymbol{S} \Rightarrow^{*} \boldsymbol{\alpha} \boldsymbol{X} \boldsymbol{\beta} \Rightarrow^{*} \boldsymbol{w}$, where $\boldsymbol{w} \in \boldsymbol{T}^{*}$. Otherwise, $\boldsymbol{X}$ is useless.

## Eliminating Useless Symbols

(1) Identify generating and reachable symbols.

- $\boldsymbol{X}$ is generating if $\boldsymbol{X} \Rightarrow^{*} \boldsymbol{w}$ for some terminal string $\boldsymbol{w}$.
- $\boldsymbol{X}$ is reachable if $\boldsymbol{S} \Rightarrow^{*} \boldsymbol{\alpha} \boldsymbol{X} \boldsymbol{\beta}$ for some $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$.
(2) Remove non-generating symbols, and then non-reachable symbols.

## Example

$$
\begin{aligned}
& S \rightarrow A B \mid a \\
& A \rightarrow b
\end{aligned}
$$

(1) Find generating symbols:
(2) Remove non-generating symbols:
(3) Find reachable symbols:
(9) Remove non-reachable symbols:

## Correctness of Useless Symbol Elimination

## Theorem

Let $\boldsymbol{G}=(\boldsymbol{V}, \boldsymbol{T}, \boldsymbol{S}, \boldsymbol{P})$ be a CFG and assume that $\boldsymbol{L}(\boldsymbol{G}) \neq \emptyset$. Let $\boldsymbol{G}_{2}$ be the grammar obtained by running the following procedure:
(1) Eliminate non-generating symbols and all productions involving those symbols. Let $\boldsymbol{G}_{2}=\left(\boldsymbol{V}_{2}, \boldsymbol{T}_{2}, S, P_{2}\right)$ be this new grammar.
(c) Eliminate all symbols that are not reachable in the grammar $\boldsymbol{G}_{\mathbf{2}}$. Let $G_{1}$ be the result.
Then, $G_{1}$ has no useless symbols, and $L(G)=L\left(G_{1}\right)$.

## Finding Generating and Reachable Symbols

(1) The sets of generating and reachable symbols are defined inductively.
(2) We can compute inductive sets via an iterative fixed point algorithm.

## Inductive Definition of Generating Symbols

## Definition (Generating Symbols)

Let $\boldsymbol{G}=(\boldsymbol{V}, \boldsymbol{T}, \boldsymbol{S}, \boldsymbol{P})$ be a grammar. The set of generating symbols of $\boldsymbol{G}$ is defined as follows:

- Basis: The set includes every symbol of $\boldsymbol{T}$.
- Induction: If there is a production $\boldsymbol{A} \rightarrow \boldsymbol{\alpha}$ and the set includes every symbol of $\boldsymbol{\alpha}$, then the set includes $\boldsymbol{A}$.

Note that the definition is non-constructive.

## Computing the Set of Generating Symbols

An iterative fixed point algorithm:

$$
\begin{aligned}
& Y:=T \\
& \text { repeat } \\
& \quad Y^{\prime}:=Y \\
& Y:=Y \cup\{A \mid(A \rightarrow \alpha) \in P, Y \text { includes every symbol of } \alpha\} \\
& \text { until } Y=Y^{\prime}
\end{aligned}
$$

## Example

$$
\begin{aligned}
& S \rightarrow A B \mid a \\
& A \rightarrow b
\end{aligned}
$$

- The fixed point iteration for finding generating symbols:

## Inductive Definition of Reachable Symbols

## Definition (Reachable Symbols)

Let $\boldsymbol{G}=(\boldsymbol{V}, \boldsymbol{T}, \boldsymbol{S}, \boldsymbol{P})$ be a grammar. The set of reachable symbols of $\boldsymbol{G}$ is defined as follows:

- Basis: The set includes $\boldsymbol{S}$.
- Induction: If the set includes $\boldsymbol{A}$ and there is a production $\boldsymbol{A} \rightarrow \boldsymbol{X}_{1} \ldots \boldsymbol{X}_{\boldsymbol{k}}$, then the set includes $\boldsymbol{X}_{1}, \ldots, \boldsymbol{X}_{\boldsymbol{k}}$.

$$
Y:=\{S\}
$$

repeat

$$
\begin{aligned}
& Y^{\prime}:=Y \\
& Y:=Y \cup\left\{X_{1}, \ldots, X_{k} \mid A \in Y,\left(A \rightarrow X_{1}, \ldots, X_{k}\right) \in P\right\} \\
& \text { until } Y=Y^{\prime}
\end{aligned}
$$

## Example

$$
\begin{aligned}
& S \rightarrow A B \mid a \\
& A \rightarrow b
\end{aligned}
$$

- The fixed point iteration for finding reachable symbols:

## Eliminating $\epsilon$-Productions $(\boldsymbol{A} \rightarrow \boldsymbol{\epsilon})$

(1) Find nullable variables.
(2) Construct a new grammar, where nullable variables are replaced by $\boldsymbol{\epsilon}$ in all possible combinations.

## Nullable Variables

Definition
A variable $\boldsymbol{A}$ is nullable if $\boldsymbol{A} \Rightarrow^{*} \boldsymbol{\epsilon}$.

## Nullable Variables

## Definition

A variable $\boldsymbol{A}$ is nullable if $\boldsymbol{A} \Rightarrow^{*} \boldsymbol{\epsilon}$.

## Definition (Inductive version)

Let $\boldsymbol{G}=(\boldsymbol{V}, \boldsymbol{T}, \boldsymbol{S}, \boldsymbol{P})$ be a grammar. The set of nullable variables of $\boldsymbol{G}$ is defined as follows:

- Basis: If $\boldsymbol{A} \rightarrow \boldsymbol{\epsilon}$ is a production of $\boldsymbol{G}$, then the set includes $\boldsymbol{A}$.
- Induction: If there is a production $B \rightarrow C_{\mathbf{1}} \ldots \boldsymbol{C}_{\boldsymbol{k}}$, where every $\boldsymbol{C}_{\boldsymbol{i}}$ is included in the set, then the set includes $\boldsymbol{B}$.

$$
\begin{aligned}
& Y:=\{A \mid(A \rightarrow \epsilon) \in P\} \\
& \text { repeat } \\
& Y^{\prime}:=Y \\
& Y:=Y \cup\left\{B \mid\left(B \rightarrow C_{1} \ldots C_{k}\right) \in P, C_{i} \in Y \text { for every } i\right\} \\
& \text { until } Y=Y^{\prime}
\end{aligned}
$$

## Eliminate $\epsilon$-Productions

Let $\boldsymbol{G}=(\boldsymbol{V}, \boldsymbol{T}, \boldsymbol{S}, \boldsymbol{P})$ be a grammar. Construct a new grammar

$$
\left(V, T, S, P_{1}\right)
$$

where $\boldsymbol{P}_{\mathbf{1}}$ is defined as follows.
For each production $\boldsymbol{A} \rightarrow \boldsymbol{X}_{\mathbf{1}} \boldsymbol{X}_{\mathbf{2}} \ldots \boldsymbol{X}_{k}$ of $\boldsymbol{P}$, where $k \geq \mathbf{1}$
(1) Put $\boldsymbol{A} \rightarrow \boldsymbol{X}_{1} \boldsymbol{X}_{2} \ldots \boldsymbol{X}_{k}$ into $\boldsymbol{P}_{1}$
(2) Put into $\boldsymbol{P}_{\mathbf{1}}$ all those productions generated by replacing nullable variables by $\boldsymbol{\epsilon}$ in all possible combinations. If all $\boldsymbol{X}_{\boldsymbol{i}}$ 's are nullable, do not put $\boldsymbol{A} \rightarrow \boldsymbol{\epsilon}$ into $\boldsymbol{P}_{\mathbf{1}}$.

## Example

$$
\begin{aligned}
& S \rightarrow A B \\
& A \rightarrow a A A \mid \epsilon \\
& B \rightarrow b B B \mid \epsilon
\end{aligned}
$$

- The set of nullable symbols:
- The new grammar without $\epsilon$-productions:

## Eliminating Unit Productions

A unit production is of the form $\boldsymbol{A} \rightarrow \boldsymbol{B}$, e.g.,

$$
\begin{aligned}
& S \rightarrow A \\
& A \rightarrow a \mid b
\end{aligned}
$$

## Eliminating Unit Productions

## Given $\boldsymbol{G}=(\boldsymbol{V}, \boldsymbol{T}, \boldsymbol{S}, \boldsymbol{P})$,

(1) Find all unit pairs of variables $(\boldsymbol{A}, \boldsymbol{B})$ such that $\boldsymbol{A} \Rightarrow^{*} \boldsymbol{B}$ using a sequence of unit productions only.
(2) Define $\boldsymbol{G}_{1}=\left(\boldsymbol{V}, \boldsymbol{T}, \boldsymbol{S}, \boldsymbol{P}_{1}\right)$ as follows. For each unit pair $(\boldsymbol{A}, \boldsymbol{B})$, add to $\boldsymbol{P}_{\mathbf{1}}$ all the productions $\boldsymbol{A} \rightarrow \boldsymbol{\alpha}$ where $\boldsymbol{B} \rightarrow \boldsymbol{\alpha}$ is a non-unit production in $\boldsymbol{P}$.
E.g.,

$$
\begin{aligned}
& S \rightarrow A \\
& A \rightarrow a \mid b
\end{aligned}
$$

## Example

$$
\begin{aligned}
S & \rightarrow A a \mid B \\
B & \rightarrow A \mid b b \\
A & \rightarrow a|b c| B
\end{aligned}
$$

- Unit pairs:
- The grammar without unit productions:

## Eliminating Unit Productions

Theorem (Correctness)
If grammar $\boldsymbol{G}_{\mathbf{1}}$ is constructed from grammar $\boldsymbol{G}$ by the algorithm for eliminating unit productions, then $L\left(\boldsymbol{G}_{\mathbf{1}}\right)=\boldsymbol{L}(\boldsymbol{G})$.

## Finding Unit Pairs

## Definition (Unit Pairs)

Let $\boldsymbol{G}=(\boldsymbol{V}, \boldsymbol{T}, \boldsymbol{S}, \boldsymbol{P})$ be a grammar. The set of unit pairs is defined as follows:

- Basis: $(\boldsymbol{A}, \boldsymbol{A})$ is a unit pair for any variable $\boldsymbol{A}$.
- Induction: Suppose we have determined that $(\boldsymbol{A}, \boldsymbol{B})$ is a unit pair, and $B \rightarrow C$ is a production, where $C$ is a variable. Then $(A, C)$ is a unit pair.

$$
\begin{aligned}
& Y:=\{ \\
& \text { repeat } \\
& \quad Y^{\prime}:=Y \\
& Y:=Y \cup\{ \\
& \text { until } Y=Y^{\prime}
\end{aligned}
$$

$$
\text { \} }
$$

## Example

$$
\begin{aligned}
S & \rightarrow A a \mid B \\
B & \rightarrow A \mid b b \\
A & \rightarrow a|b c| B
\end{aligned}
$$

The fixed point computation proceeds as follows:

$$
\begin{aligned}
& \{(S, S),(A, A),(B, B)\} \\
& \{(S, S),(A, A),(B, B),(S, B),(B, A),(A, B)\} \\
& \{(S, S),(A, A),(B, B),(S, B),(B, A),(A, B),(S, A)\} \\
& \{(S, S),(A, A),(B, B),(S, B),(B, A),(A, B),(S, A)\}
\end{aligned}
$$

## Putting them together

Apply them in the following order:
(1) Eliminate $\epsilon$-productions
(2) Eliminate unit productions
(3) Eliminate useless symbols

## Theorem

If $\boldsymbol{G}$ is a CFG generating a language that contains at least one string other than $\epsilon$, then there is another CFG $G_{1}$ such that $L\left(G_{1}\right)=L(G)-\{\epsilon\}$, and $\boldsymbol{G}_{\mathbf{1}}$ has no useless symbols, $\boldsymbol{\epsilon}$-productions, or unit-productions.

## Proof.

## Chomsky Normal Form

## Definition (Chomsky Normal Form)

A grammar $\boldsymbol{G}$ is in CNF if all productions in $G$ are either
(1) $\boldsymbol{A} \rightarrow \boldsymbol{B C}$, where $\boldsymbol{A}, \boldsymbol{B}$, and $\boldsymbol{C}$ are variables
(2) $\boldsymbol{A} \rightarrow \boldsymbol{a}$, where $\boldsymbol{A}$ is a variable and $\boldsymbol{a}$ is a terminal

Further, $\boldsymbol{G}$ has no useless symbols.

## Putting CFG in CNF

(1) Start with a grammar without useless symbols, $\epsilon$-productions, and unit productions.
(2) Each production of the grammar is either of the form $\boldsymbol{A} \rightarrow \boldsymbol{a}$, which is already in a form allowed by CNF, or it has a body of length 2 or more. Do the following:
(1) Arrange that all bodies of length 2 or more consist only of variables. To do so, if terminal $\boldsymbol{a}$ appears in a body of length 2 or more, replace it by a new variable, say $\boldsymbol{A}$ and add $\boldsymbol{A} \rightarrow \boldsymbol{a}$.
(2) Break bodies of length 3 or more into a cascade of productions, each with a body consisting of two variables. To do so, we break production $\boldsymbol{A} \rightarrow \boldsymbol{B}_{1} \boldsymbol{B}_{2} \ldots \boldsymbol{B}_{\boldsymbol{k}}$ into a set of productions

$$
\begin{aligned}
& A \rightarrow B_{1} C_{1} \\
& C_{1} \rightarrow B_{2} C_{2} \\
& \cdots, \\
& C_{k-3} \rightarrow B_{k-2} C_{k-2} \\
& C_{k-2} \rightarrow B_{k-1} B_{k}
\end{aligned}
$$

## Summary

- Every CFG can be transformed into a CFG in CNF
- To do so,
(1) Apply $\epsilon$-production, unit production, useless symbols eliminations
(2) Arrange and break remaining productions.
